

Requirements & Design · v1.2

Kuja tenant · slug=kuja

2026-08-14

The easiest end-to-end grant system to comply with.

A donor defines a grant's criteria once. From there the system helps the NGO apply accurately, scores it fairly with AI *and* humans, and keeps everyone on top of every deliverable — offline, in five languages, on a cheap phone.

Finding (verified against the code): the Kuja tenant already implements most of what follows. The work ahead is **consolidation, clarity, and polish** — not net-new features. Each function below is tagged ● LIVE ● PARTIAL ● GAP.

New in v1.2 — shipped & live this cycle (commit `60408f4a3`): the **donor approval inbox** (pre-scored deliverables → accept / request-revision) ● LIVE · a standing **end-to-end core-lifecycle test**, 30/30 green ● LIVE · **scoring clarity** (`auto_score` alias) ● LIVE · a latent report-webhook bug fixed. The one substantive piece still open is applying this page's redesign direction across the live screens.

01 The core idea — one rubric, three consumers

Everything hinges on one fact: a grant's criteria are defined once, then power the whole lifecycle. That coherence is what makes our promise true rather than a slogan.

One definition, four consumers — the reason we can say "we know what the grant requires, so we make it easy to apply accurately, score fairly, and comply on time."

02 Grant creation — two on-ramps, one wizard

Two ways in, converging on one editable wizard, then review-as-applicants-see-it, then publish.

ON-RAMP A · UPLOAD

Upload the call ● PARTIAL

Drop a PDF/DOC. AI extracts the skeleton and pre-fills the wizard; every item tagged `ai_extracted` / `edited` / `manual` and fully editable.

ON-RAMP B · GUIDED

Guided questions ● LIVE

No document? The 6-step wizard asks plain questions — who can apply, what you'll fund, how you'll decide, what you need back and when — and builds the same grant.

CONVERGE

Review & publish ● LIVE

See the grant as applicants will, confirm, publish. Fans out matches + alerts. Reusable criteria templates make repeat grants one click.

Real gap: today the upload pass extracts the *reporting deliverables* well; eligibility + weighted criteria + documents are filled by separate AI calls in the wizard. **Improvement:**

one extraction that fills the whole skeleton — including deliverables *with due dates* — into the wizard for review.

03 Applying — the heart: in-context, criterion-aware AI

Because we hold the grant's exact criteria, we help the NGO write an accurate, competitive application inline — as they type, not via a chatbot.

Live today: draft / strengthen / polish, autofill from prior winning apps + capacity profile, live rubric preview, pre-submit readiness, voice input, offline autosave. **Improvements:** make "what a strong answer covers" explicit per criterion; a reusable **evidence library** the NGO builds once; consolidate the assistants into one calm panel. AI proposes — the NGO owns every word.

04 Scoring — AI *and* human, cleanly separated

The system already has three signals. The improvement is naming and clarity, so donors trust the result — not new capability.

SIGNAL	WHAT IT IS	ROLE	STATE
Eligibility gate	Deterministic pass/fail on hard requirements	Screens out ineligible	● LIVE
Completeness (now mis-named <code>ai_score</code>)	Heuristic: completeness, keywords, docs	Flags thin submissions	● RENAME
AI first-pass	LLM per criterion: score + rationale + confidence + provenance	NGO self-check · reviewer head-start · ranking	● LIVE
Human score	Reviewers score per criterion; weighted mean	Authoritative for the award	● LIVE
Calibration	AI-vs-human agreement, divergence + outlier flags	Quality loop; AI never awards	● LIVE

Net: AI proposes and accelerates; humans decide; both are visible and comparable. The only real change is retiring the misleading `ai_score` field name and shaping the AI first-pass as a clean per-criterion object.

05 Deliverables, compliance & reporting

Make it easy for NGOs to comply with every requirement on time — and easy for donors to see what's due and what's ready to approve.

● Financial — Youth Fund

flagged

- **Deliverables calendar** for NGO *and* donor, subscribable via `.ics` , plus at-risk prediction — ● LIVE .
- **Reporting** — voice-to-report, photo evidence, AI pre-check, bundle + PDF — ● LIVE .
- **Financials with & without our ERP** — one normalized shape (ERP feed or manual/uploaded); operator mapping + donor financials panel shipped this cycle — ● LIVE (feed pending one Build call).
- **Gap:** a unified dated **Obligations/Deliverables** entity (per-item status) + a donor **approval inbox**. The Proximate tenant already proved this pattern — it's portable to Kuja.
- **The flywheel:** on-time, high-quality compliance feeds the NGO's Trust Profile → faster future eligibility → the portable-trust moat. Behaving well on one grant makes the next one easier.

06 Dashboards & UX — clean, uncluttered, action-oriented

One primary action per screen. Summary before detail. State shown in form — a chip, a due-soon stripe, an at-risk color — so what needs attention reads at a glance. The mockups above are the target visual direction.

On "the UI looks dated": the app is feature-complete but visually busy in places (tile sprawl, dense panels). The move is a **design-system pass** — the calm patterns shown here, redundant tiles retired, hierarchy and spacing modernized — not a rebuild. Prior work already started this (collapsed the NGO tile wall; "one obvious next action"; simplified the apply page).

07 Current state → target

● LIVE ● PARTIAL ● GAP

CAPABILITY	STATE
Grant creation — guided wizard · upload→AI extract deliverables · editable/tagged · review→publish · templates	● LIVE
Grant creation — one upload pass fills the whole skeleton (eligibility+criteria+docs+dated deliverables)	● GAP

CAPABILITY	STATE
NGO in-context AI — draft/strengthen/polish, autofill, live rubric, readiness, voice, offline autosave	● LIVE
NGO — criterion-aware "strong answer" guidance + reusable evidence library	● PARTIAL
Scoring — deterministic + AI + human + calibration + adopt-AI-score	● LIVE
Scoring — <code>auto_score</code> alias + documented 3-signal model	● LIVE
Scoring — per-criterion AI first-pass object <code>{score, rationale, confidence, provenance}</code>	● GAP
Donor application-status (funnel, awaiting-decision, applicant table, CSV)	● LIVE
Deliverables calendar (NGO+donor, .ics) + at-risk prediction · reporting (voice/photo/bundle/PDF)	● LIVE
Donor approval inbox (pre-scored reports → accept / request-revision)	● LIVE
Standing end-to-end core-lifecycle health check (30/30 green)	● LIVE
Unified Obligations/Deliverables entity (dated, first-class)	● GAP
Financials abstraction + operator mapping + donor financials panel	● LIVE
Trust Profile (two-pillar, local) + screening	● LIVE
Link SSO + billing webhook · Trust remote cutover · Build finance call · SAM.gov · offline submit/report · localization	● GAP
Dashboards — clean/consolidated design-system pass	● PARTIAL

08 Roadmap (priority-ordered)

PHASE A · HIGHEST

Core stability & clarity

End-to-end health check on prod; scoring clarity (rename + per-criterion AI object); dashboards design-system pass.

PHASE B

The NGO moat

Criterion-aware "strong answer" guidance + reusable evidence library; offline outbox on application + report submit.

PHASE C

Deliverables engine

Unified Obligations/Deliverables entity (adopt the proven Proximate pattern) → one source for calendar, next-action, approval inbox.

PHASE D

Creation completeness

One upload pass fills the full skeleton with dated deliverables.

PHASE E · EXTERNAL

Integrations

Link SSO + webhook; Trust remote cutover (after identity backfill); Build finance call; localization. Mostly blocked on inputs.

Full detail, endpoints, and data shapes: `docs/KUJA_TENANT_SPEC.md`.
